Dear Hiring Manager,

I am writing to apply for the Backend Developer position. I am a backend developer with hands-on experience building and shipping production-grade systems at scale. Over the past year I designed and built QuickAir — a B2B flight aggregation platform concurrently searching 12 Nigerian airlines in real time — and MyRoomStatus, a full-stack hotel property management system deployed in both cloud SaaS and standalone offline configurations. Both are live and serving real users.

My core stack is Go (GoFiber, GORM) paired with PostgreSQL, with hands-on experience in headless browser automation and web scraping, WebSockets, Server-Sent Events, and third-party API integrations — including Paystack, Google Gemini AI, and five different IoT smart-lock vendors behind a single unified interface. I've also worked with Python (Django) and PHP (Laravel) on freelance projects, and I'm comfortable across the full deployment pipeline: Git, GitHub Actions, Linux, Docker, and AWS.

I built MyRoomStatus to run identically as a cloud SaaS product and as a standalone offline binary from a single codebase — the kind of constraint that forces real discipline in how a system is architected, not just how it's written. That's the standard I hold my own work to.

I've also spent time teaching Python and JavaScript fundamentals to new developers, which sharpened how clearly I communicate technical ideas to people at different levels.

I'm looking to bring that same hands-on, ship-it approach to a team building products at real scale, and I'd welcome the chance to discuss how I can contribute.

Sincerely,
Paulson Bosah
